

— How it started?

US build a project called ARPA - Advanced research projects agency
They had there buildings but were very far. So they developed ARPA NET

Locations were -

They used TCP for this

TCP- Transmission control Protocol

The rules which are being set by people that how a particular data is being sent, these are known as protocols.

Ex → TCP, IP, UDP

Problem

So, for ex we prepared a research paper in MIT and sent to UTAH but it contained a link of other research paper. Which wasn't shared. i.e it wasn't automated.

So came up with the (www) - world wide web

→ **www** basically stores all the documents, and can access them via **www**.

→ The internet society is responsible for creating different rules and protocols.
